

Fairlead Boatworks ~ Lead Paint Remediation

Paint removal for welding pathways enabling hull improvements.

BEFORE

AFTER

Paint Remediation

Details:

- Owner: United States Coast Guard
- General Contractor: Macsons
- Project Name: Lead Paint Remediation, USCGC Sledge & Barge
- Location: Fairleads Boatworks, Newport News, VA

Description:

Macson's completed the abatement and remediation of 1,345 square feet of lead and asbestos from this US Coast Guard Cutter "Sledge." Paint with regulated compounds was safely contained and removed, aboard this vessel and an associated barge, by using an innovative new laser technology combining the use of a water vapor suppressed media blaster with air powered needle scalers. Working over several daily shifts, multiple crews were scheduled to accomplish the work under an accelerated time frame, so that the shipyard could recoup the cost of previous schedule delays and unforeseeable setbacks.
